Bradbury-Sullivan LGBT Community Center

LGBTQA Community Health Needs Assessment Results

BRADBURY-SULLIVAN
LGBT COMMUNITY CENTER

*Serving the LGBT Community
of the Greater Lehigh Valley*

Study Purpose

This study assessed the prevalence of tobacco use, other chronic disease risk behaviors, and determinants of health in the lesbian, gay, bisexual, transgender, queer, and asexual (LGBTQA) communities of the Greater Lehigh Valley—the catchment area of the Bradbury-Sullivan LGBT Community Center.

Methodology

Brief, anonymous, Internet-based surveys were completed by LGBTQA people in the five-county region served by the Bradbury-Sullivan LGBT Community Center, which includes Berks, Carbon, Lehigh, Northampton, and Monroe Counties in the state of Pennsylvania.

During a 3-week period in June 2015, LGBTQA participants were purposively sampled using both direct and indirect recruitment strategies. Direct recruitment strategies included sending personal emails and Facebook messages to LGBTQA people. Indirect recruitment strategies included geographically targeted and LGBTQA-targeted Facebook advertisements, as well as email blasts from the Bradbury-Sullivan LGBT Community Center, Reading Pride Celebration, and Pride of the Greater Lehigh Valley.

Participants were informed that the data they provided were being collected anonymously and that they could stop the survey or refuse to answer any questions at any time. At the conclusion of the survey, participants were given the option to be redirected to an unlinked database where they could input their contact information to be entered into a lottery drawing for one \$50 gift card incentive.

Acknowledgements

This study was commissioned by the Bradbury-Sullivan LGBT Community Center with funding from the Pennsylvania Department of Health and Tobacco Free Northeast PA. Robert W.S. Coulter, M.P.H., served as the Statistical Data Analyst for this project: he conducted the data analyses and wrote the results. Scout, Ph.D., from LGBT Health Link, designed the questionnaire, helped guide survey administration, assisted in interpreting results, and drafted the recommendations for this report.

Highlights

Sociodemographic Characteristics

In total, 614 LGBTQA individuals completed this survey. Three-quarters of the sample identified as gay/lesbian, 10.1% as bisexual, and 9.9% as queer or pansexual. Additionally, 12.1% of the participants were transgender, 44.6% were cisgender men, and 41.4% were cisgender women. The sociodemographic characteristics of the participants in this sample were quite comparable to overall demographics of the Greater Lehigh Valley region, despite LGBTQA participants in this report being conveniently sampled.

Health Care Access & Quality

Health care coverage was highly prevalent in the sample (91.4%), and slightly higher than the prevalence of health care coverage among Pennsylvania adults (which was 85% according to the 2013 Behavioral Risk Factor Surveillance System [BRFSS]). About one-quarter (23.9%) of the sample had a health care provider react poorly to their LGBTQA status—and this varied by gender: transgender people (45.2%) were significantly more likely than cisgender men (21.0%) or women (19.9%) to have a provider react poorly. Additionally, transgender people (32.9%) were more likely than cisgender men (8.8%) and women (7.2%) to always or often fear a negative reaction by a health care provider. Nevertheless, most participants (85.1%) were out as LGBTQA to one or more of their health care providers.

LGBTQA Acceptance

LGBTQA participants thought their friends were the most LGBTQA-accepting (86.7% thought their friends were very LGBTQA-friendly). Next most accepting were participants' workplaces and birth families (54.4% and 50.4%, respectively, thought these groups were very LGBTQA-friendly). Schools and medical providers were not terribly accepting overall (41.8% and 30.4%, respectively, thought these groups were very LGBTQA-friendly). Neighborhoods were the least LGBTQA-friendly places (20.5% thought their neighborhood was very friendly).

Overall Health

About two-thirds of participants reported that their overall health status was good or very good. Importantly, participants' self-reported overall health status was significantly greater if they reported greater overall LGBTQA acceptance across the domains specified above. Nearly all respondents were interested in incorporating more healthy living strategies into their lives.

Body Mass Index

According to participants' body mass index (BMI), 40.9% were obese and 29.4% were overweight; this did not significantly vary by gender. Among the general population of Pennsylvania adults, 30.0% of adults were obese and 34.5% were overweight (BRFSS, 2013), suggesting that the LGBTQA population in the Greater Lehigh Valley may be slightly more overweight/obese than the general Pennsylvanian population. Importantly, about two-thirds of LGBTQA participants were interested in health eating (63.7%) and active living strategies (62.7%).

Mental Health Treatment

In the past 12 months, 32.5% of participants received psychological counseling or treatment. In their lifetime, more than half of the sample had taken medicine or received treatment for mental health problems.

HIV among Cisgender Men and Transgender People

HIV prevalence was significantly higher for cisgender men (8.1%) than transgender people (2.9%). Regular HIV testing was low. Excluding HIV-positive participants, 40.9% of cisgender men and 36.7% of transgender people received their last HIV test within the past year. The Centers for Disease Control and Prevention (CDC) recommends that high-risk groups get tested for HIV at least once per year, and more often for sexually active high-risk groups.

Tobacco Use & Opinions

In the past year, 37.0% of participants used any tobacco/nicotine products, and this significantly varied by gender: transgender people (48.6%) reported higher tobacco use than cisgender men (41.6%) and women (29.1%). Specifically, cigarette smoking was higher among LGBTQA participants than the general Pennsylvanian population (30% versus 21%, respectively; BRFSS, 2013). On a positive note, LGBTQA participants used smokeless tobacco (e.g., chew or snuff) less than the general Pennsylvanian population (1% vs. 4%; BRFSS, 2013).

LGBTQA people had little knowledge about smoking disparities: 36.1% strongly or somewhat agreed that LGBTQA people smoke more than the general population. About three-quarters of LGBTQA participants were strongly or somewhat unappreciative that the tobacco industry advertises to the LGBTQA community; and 51% strongly or somewhat agreed that pride celebrations should be smoke-free events.

LGBTQA smokers overwhelmingly wanted to quit (92.7%), with the largest group of those wanting to quit within the next six months. When asked how they would quit, willingness to use effective cessation techniques was low: 27.8% of smokers would go to their health care provider, and 10.8% would enroll in a smoking cessation class or program; however, only 4.4% would use the quitline, and over one-quarter of smokers did not know where to go for cessation assistance.

Cancer

The lifetime prevalence of cancer was 9.4% among LGBTQA participants (and this did not significantly vary by gender). Participants reported moderate levels of cancer screenings. Only half of the participants who were assigned female at birth reported not being up to date with cervical Pap smears. Among participants 50 years or older: 62.9% were up to date with colonoscopies; 69.2% of those assigned female at birth were up to date with mammograms; and 72.3% of those assigned male at birth were up to date with prostate exams. Only 16.6% of cisgender women, 8.9% of cisgender men, and 11.0% of transgender people reported ever having had an anal Pap smear. LGBTQA participants believed there was a high need for a variety of LGBTQA-welcoming practices for cancer care, including survivor support groups, caregiver support groups, inclusive hospital policies, and legal planning at hospitals.

Perceptions of LGBTQA Community Health Issues

Mental health, STDs/HIV, and suicide were perceived to be the top three health problems by LGBTQA participants.

Recommendations

Because tobacco use greatly affects the health of LGBTQA people, the lack of knowledge about LGBTQA smoking disparities and tobacco cessation programs are of particular concern. The following steps would help address this problem:

- Create LGBTQA-tailored smoking cessation groups;
- Train quitline providers to be LGBTQA friendly and affirming;
- Create LGBTQA-tailored quitline promotion campaigns to raise awareness for this cessation resource; and
- Create LGBTQA-tailored tobacco awareness campaigns to raise the knowledge level about LGBTQA smoking disparities and help people make healthier decisions.

Because many LGBTQA participants experienced LGBTQA-unfriendliness by a medical provider and perceived a high-need for LGBTQA-related cancer programs, enhancing the LGBTQA-friendliness of medical environments would have many benefits. The following steps would help address this need:

- Train medical providers to be LGBTQA culturally competent and to provide LGBTQA competent health care; and
- Design and disseminate LGBTQA-tailored materials that help make medical environments more LGBTQA-friendly.

To monitor the health of LGBTQA participants in the Greater Lehigh Valley region, LGBTQA health surveillance data should be routinely collected.

Results

In total, 614 LGBTQA individuals completed the survey. In this report, transgender is used as an umbrella term for the following individuals:

- People who identified as a trans man/woman or trans masculine/feminine
- People who identified as agender, bigender, demigirl, fluid, non-conforming, non-binary, genderqueer, or Two-Spirit
- People whose assigned sex at birth does not match their current gender identity (e.g., someone who was assigned male sex at birth and now identifies as female)
